

HAF®

STIMULATE

Its high content of seaweed extracts obtained by thermophysical means improves fruit setting and increases the homogeneity of the fruits.

HAF™
HISPANO-AMERICANA
DE FERTILIZANTES

Haf[®] STIMULATE is a biostimulant rich in seaweed extracts (brown seaweed, or Phaeophyceae group) with a high concentration of active substances, nutrients, and its own secondary metabolites. They ensure the highest agronomic efficiency on the market.

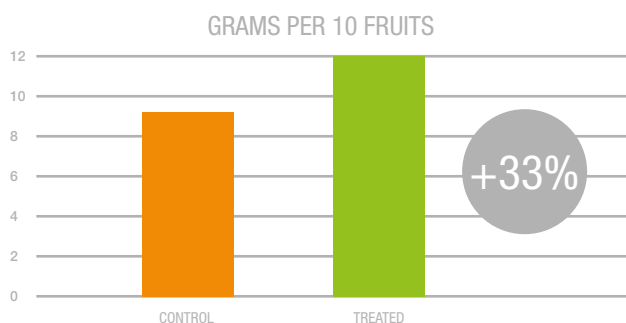

Our algae extracts are obtained exclusively through thermophysical processes consisting of cryogenesis and subsequent pressing of the algae. This state-of-the-art extraction technique allows us to obtain algae extracts of the highest quality, as it preserves the qualities of the natural substances present in the algae.

Haf[®] STIMULATE therefore presents regulatory and enhancing properties at all stages of the crop cycle, as the product is 100% natural and hormone-free.

VALID FOR ANY TYPE OF CROP

TRIAL

The aim is to stimulate higher quality fruiting by improving the fruit set, increasing fruit homogeneity, and preventing malformations and abortions.

CONTROL

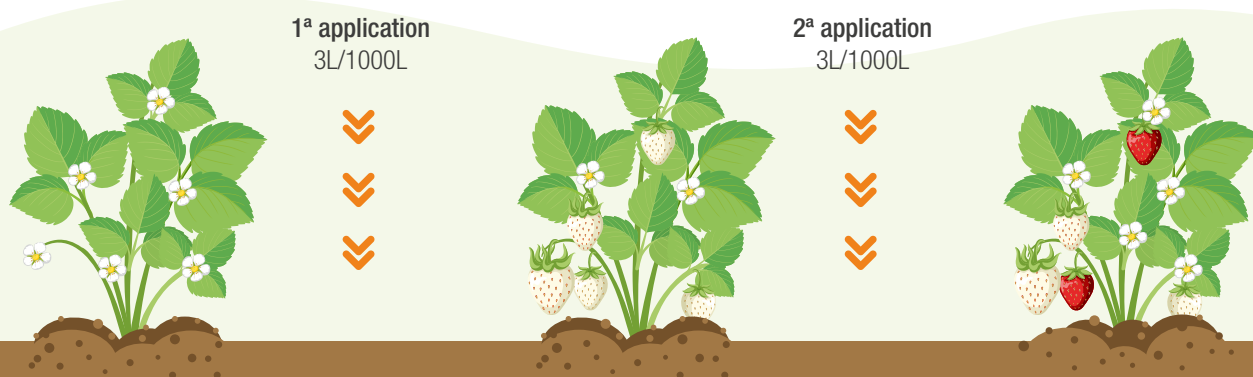

TREATED

BENEFITS

- ✓ Natural alternative to the use of hormones for fruit set.
- ✓ Respectful of pollinating insects.
- ✓ Promotes fruit set.
- ✓ Standardises fruit size.
- ✓ Increases pollen quality.
- ✓ Helps to overcome the post-transplantation crisis.
- ✓ Biostimulates crop growth generally.
